Table 1: Where the input enters (C1). Absolute NRMSE (mean over seeds) and paired change vs latent injection (mean of per-seed relative changes). HyperKKL ($r = 4$): hypernetwork generating rank-4 decoder weight updates from the input-history context. **Bold**: 95% CI (Student-t over seeds) excludes 0, better; underlined: excludes 0, worse. Dev systems: C1-where (5 seeds); TEST systems: TEST-C1, frozen recipe (3 seeds). †: NRMSE above climatology (worse than the constant mean-state predictor). Last rows per block: vote counts (single-method reading, author decision 2026-10-26; the pre-registered outcomes are in Table **??**).
