Table 1: Ablation (appendix): dense-subspace generator vs HyperKKL ($r = 4$). The dense generator produces every decoder weight update inside a fixed k-dimensional linear subspace ($k = 4$ at 140k, Table **??**). Absolute NRMSE and the paired change of the dense generator vs HyperKKL (bold/underline: 95% CI excludes 0). Never used in the headline counts.

split / tier	system	latent	HyperKKL	dense	dense vs HyperKKL
