Table 1: Where KKL's advantages should show (C3-regimes, partial knowledge, dev systems, sequence OOD). Per condition: systems where HyperKKL ($r = 4$) beats the best grey-box filter (partial model + learned residual, same data: greybox_ekf/ukf/ekf_oracle) with a paired 95% CI excluding 0; $\geq 4/6$ = KKL-wins regime (rule written before the runs for the best of lora/hyper; read with the single method, author decision 2026-10-26). NRMSE: median [min, max] over systems; div.: mean divergence rate; forget: paired forget-prior time (poor_init only), mean over systems. KKL / GB = best KKL / best grey-box. Jobs: 18/18.

condition	KKL wins	GB wins	NRMSE KKL	NRMSE GB	div. KKL/GB	forget KKL/GB (s)
clean	3/6	3/6	0.0626 [0.018, 0.075]	0.0224 [0.0078, 0.28]	0.00/0.00	–
poor_init	3/6	3/6	0.0626 [0.018, 0.075]	0.0226 [0.0078, 0.28]	0.00/0.00	13.1/2.3
